Meditation, Social Change, and Undergraduate Education

by Steven C. Rockefeller

It is the purpose of this essay to explore ways in which the American undergraduate college can provide students with opportunities for understanding, appreciating, and practicing the meditative and contemplative disciplines. Since the assumption underlying this inquiry is a belief that meditation can serve as an instrument of beneficial social change in American society, it is useful at the outset to clarify the kind of social change that is desirable and to suggest at least some ways meditation might be complementary to or even a force for such change.

Directions for Creative Social Change

One way to generalize the nature of the creative social movements in America today is to view them as part of a threefold development that involves:

- (1) an extension and deepening of the democratic revolution,
- (2) a furthering of a new ecological reconstruction of how people think and live, and
- (3) a fresh spiritual awakening to the sacredness of life and the Earth.

The democratic movements include the battle for women's rights and minority rights, the promotion of tolerance, the celebration of diversity, the empowerment of people to solve public problems, the spread of industrial democracy, a new emphasis on I-thou relationship and community, and international cooperation on behalf of peace, human rights, economic opportunity, and the environment. The ecological revolution is founded on new scientific discoveries in astronomy, biology, cosmology, ecology, physics, and psychology. It emphasizes holistic and global thinking, and it is guided by a new moral awareness expressed in the imperative: respect and care for the whole community of life. This means restoration of ecosystems, a new eco-economics, sustainable modes of living, and subordinating the principle of national sovereignty to international cooperation.

The spiritual awakening involves a new sense of wonder in the face of the

mystery and beauty of the natural world and a rediscovery of the sacred. It entails a realization of the sacredness of one's own life and of all life. It involves an integration of the sacred and the secular, spiritual life and everyday life. It recognizes that ultimate meaning is found in and through the development of a compassionate, democratic and ecological self that is inclusive, expanding to embrace all life.

These three movements are often interrelated, and they can be understood as different aspects of one larger unified transformation of social consciousness. The concern is to join and integrate the search for power and material progress on the one hand with the quest for wisdom and well-being on the other. The general objective is a way of being that will enable people to humanize technology, realize the full promise of democracy, heal the Earth, and celebrate life.

There are two fundamental ways to advance social change. One involves reconstructing the social environment that shapes the way people interact and behave. The other involves healing individuals and changing their character orientation transforming their awareness, attitudes, and values. Both are necessary. The two ways can and should complement and reinforce each other.

Meditation and Social Change

Can meditation produce transformations of consciousness in individuals consistent with the changes in social habits, laws, and institutions inspired by creative democracy and the environmental movement? Can meditation help people realize the democratic-ecological self? Is there the possibility that meditation could add a unique quality and depth to democratic-ecological living, adding balance and perspective? In short, should Americans include meditation and contemplative disciplines in their vision of the way to individual freedom, community, and fulfillment? The answer is a qualified yes.

First of all, it is important to keep in mind that the American experiment with meditation is just beginning, and there is much that Americans have yet to learn about the nature of meditation, its dangers, and its potential as an instrument of growth and transformation in a democratic-ecological context. The experience of Americans to date indicates that it is not a substitute for the learning and psycho-social development that comes in and through living and working with others. It is not a substitute for searching rational inquiry and critical reflection. As a general rule, it is a mistake to think that it can or should be used with Westerners to address the problems in personality development for which psychotherapy has been developed. However, there is much evidence that suggests that under the guidance of well-trained, experienced and responsible teachers, meditation can be of benefit to many people when they are ready for it, helping them to grow in unique ways and to promote creative social change.

There are, of course, many different meditative and contemplative disciplines, and the kind of practice that is appropriate for any one individual will depend on what stage in the human life cycle the person is at and on his or her special needs and abilities. The most basic forms of meditation involve techniques of concentration that bring calm and clarity to the body-mind. Many of the more advanced forms are designed to help a person to move beyond a narrow atomistic sense of self and to develop a sense of belonging to and identity with others and the larger community of being.

It has been experimentally documented that certain forms of meditation may improve physical health. There are meditation practices that can be used to improve athletic and artistic performance. Contemplative disciplines may help some people become less frenetic and more centered, more aware of the goodness and beauty of their own being, more appreciative of the intrinsic value of other beings, more responsive to suffering, more attentive and mindful, more open to I-thou relationship and meaning. When meditation affects a transcendence of ego-centered awareness, it may deepen consciousness of the sacred.

The full significance of meditation is missed if it is viewed just as a technique, that is, solely as a means to ends beyond itself, such as health, social change, or even enlightenment. Contemplation is a form of human activity that possesses its own inherent value, and it may involve a beautiful experience that is a fulfillment complete in itself. In this sense it is an end in itself. If American society were to understand and accept this notion, this alone would cause a beneficial change of attitude regarding the place of contemplation in culture. Furthermore, the full benefits of meditation only follow upon wholehearted engagement with the discipline, and this requires that the practitioner view it as a end and not just as a means.

There is also very limited value in thinking about meditation as an isolated practice. The larger intellectual and moral environment in which meditation is done influences the way people understand and approach it and the effect that it has. In some cultures, for example, meditation has been used to reinforce and implement philosophies of quietism or of world denial and extreme asceticism. However, there are also many examples of where meditation has been associated with a world-affirming ethical mysticism and even revolutionary social change. In addition, the physical environment in which meditation is practiced is important especially for beginners because it may be more or less conducive to concentration and because it also reflects certain values and attitudes. In American culture the challenge is to set the practice of meditation in the context of a worldview that affirms a healthy balance between inwardness and activism, concentration and going forth into relationship, quiet contemplation and social responsibility.

Higher Education and Meditation

The modern secular university is centrally concerned with scientific research and the arts of critical rational reflection. The university trains the teachers who form the faculties of undergraduate institutions, and the influence of the university is the dominant force shaping undergraduate education. The central mission of the undergraduate college is to train and nurture the growth of the human mind, especially the powers of critical reason.

There are, of course, many dimensions to a liberal arts education. There are courses that emphasize the human imagination, explore the art of appreciation, and nurture creative self-expression through the arts. Undergraduate schools have their athletic programs and a great variety of other extracurricular activities that evolve to reflect student interests. There are numerous opportunities for off-campus and overseas study. Up through the Second World War most colleges required attendance at chapel, reflecting a concern to shape the moral and religious sensibilities of students, but required chapel has been abandoned in the vast majority of colleges. Today moral education occurs primarily in and through enforcement on campus of codes of conduct that emphasize respect for persons and diversity. Recognizing the many pressures upon undergraduates and their emotional needs, most schools have introduced opportunities for short-term psychological counseling.

Even though there are these diverse offerings, which reflect at least some concern with the whole person and with the diversity of human interests and talents, the strong emphasis remains on critical reason, and especially on methods of knowledge that have a practical bearing. Critical reason is one of the finest flowers of Western civilization. Its cultivation and exercise are essential to the development of autonomy and a healthy democratic society and to caring for the Earth. That undergraduate education should emphasize the experimental method of knowledge and the arts of critical reflection is not to be questioned. A question can be raised about whether the education of the undergraduate college in America today fails to put science and discursive reason in proper perspective and whether it tends to encourage a character orientation that is too head-centered as distinct from heart-centered, more interested in information than appreciation, more concerned about the knowledge which is power than wisdom and ethical values, more oriented toward I-it than I-thou, more skilled at striving for future ends than living a fulfilling life in the present. It is a question of balance.

This is a complex issue, for which there is no simple answer, and the university and college by themselves cannot solve this problem. However, a fresh appreciation for contemplative experience may be one element in a larger strategy for dealing with the issue. Two hundred years ago Friedrich Schleiermacher, the founder of the liberal Christian tradition, leveled a criticism that addresses this question. He pointed out that every person is born with a capacity to experience directly the mystery, wonder, and beauty of the world, which is essential to human well-being and a sense of the joy and meaning of life. However, he lamented that this capacity is "crushed out" of children in the course of their education by the modern "rage for calculating and explaining"

under the leadership of "the discreet and practical men" who dominate society. "In everything there must be design and aim; something has always to be performed, and if the spirit can no more serve, the body must be exercised. Work and play, but no quiet, submissive contemplation," wrote Schleiermacher.¹

1 Friedrich Schleiermacher, *On Religion: Speeches to its Cultural Despisers*, trans. John Omen (New York: Harper & Row, Publishers, 1958), pp. 124-30.

Most American schools at all levels reflect the bias that Schleiermacher criticizes. In the early grades, the best way to address this imbalance is a new emphasis on the arts and a concern on the part of teachers to respect and nurture the sense of wonder in children as essential to their well-being. In the American college, along with strengthened programs in the arts and related fields, students can benefit from greater opportunities to study and experience the meditative and contemplative disciplines.

Strategies for Acquainting Students with the Nature and Practice of Meditative Disciplines

Need for Research and Teaching

First of all, meditation needs to be de-mythologized in the American mind so that people have a rational understanding of what it is and can and cannot do. On the one hand, the majority of Americans still view meditation suspiciously as something of a weird Eastern practice that is essentially passive, self-centered, and otherworldly. On the other hand, there are those who think of it as a cure-all or as a short cut to enlightenment and bliss that enables a person to leap frog whole developmental stages. The truth about meditation should be carefully researched and studied in the university and college, so that Americans can develop an informed understanding of its history, varied nature, proper uses, and social value. To what extent is it possible for contemporary lay people to take advantage of the contemplative disciplines that have been developed by men and women living cloistered lives in monasteries and nunneries? How are the effects of contemplative practice to be understood in relation to the transformations of consciousness essential to the deepening of spiritual democracy, healing the Earth, and international peace and cooperation?

Meditation and Developmental Psychology

More work is needed on the relations between psychology and contemplative science. How is the Western idea of developmental stages related to the developmental stages envisioned by contemplative psychologies and philosophies? Does the contemplative understanding of spiritual development alter or expand the vision of Western psychology, and, if so, how? Is it possible to construct an idea of universal human developmental stages that

integrates Western science and contemplative science?

New research is needed on the effects of meditation on human growth and mental illness at each different stage in the life cycle. For example, what forms of meditation may be helpful to adolescents? What risks and dangers are involved when college aged students engage in various forms of meditation? A recent study has warned that a person who has failed to develop a strong sense of self is not fit to engage in contemplative disciplines designed to help the practitioner realize the truth of no-self, and that if such a person pursues these disciplines, there is a risk of pathological consequences.² This caution should be taken very seriously. In what situations is psychotherapy rather than meditation the most appropriate method of healing and growth? In what situations can a meditative discipline be used to complement psychotherapy? In what situations should a person turn to meditative disciplines rather than psychotherapy for growth and transformation?

The Role of Religion and Social Science Departments

Religion departments and social science departments like psychology and sociology have a special role to play in pursuing research and teaching regarding the history, methods, and social significance of meditative and contemplative disciplines.

The American interest in meditation in recent decades has been closely related to the explosion of interest in Asian religions which occurred in the 1960's and 1970's. This fascination with Asian religions was to a large degree fueled by a hunger for transformative experience among a new generation of young people, who found traditional forms of Christianity and Judaism too focused on doctrine and law and out of touch with the living truth. Traditions like Buddhism, Hinduism, and Taoism seemed to offer Americans spiritual disciplines in the form of meditative practices that could open the door to liberating experiences and enlightenment.

Prior to the 1960's very few Americans had ever actually practiced meditation even though an interest in Asian religions had been slowly developing ever since the Parliament of World Religions in 1893. However, during the 1960's this changed. All over America small groups, largely made up of young people, began training with teachers from China, India, Japan, Tibet, and Southeast Asia. A few of these teachers were Americans who had gone overseas to be trained. For the first time it was possible for an average American to receive formal training in a variety of Eastern meditative disciplines in the United States. Among those who turned East were a number of men and women who chose academic careers. As a result of all these factors a vast new literature on meditation practice in Asia has been generated.

² See Jack Engler, "Therapeutic Aims in Psychotherapy and Meditation," in Ken Wilber, Jack Engler, and David P. Brown, Transformations of

Consciousness: Conventional and Contemplative Perspectives on Development (Boston: Shambhala, 1986).

The fascination with Eastern meditative practices stirred fresh interest in traditions of contemplative prayer, meditation, and mysticism in Christianity and Judaism. Efforts were made by Christians and Jews to retrieve lost traditions of contemplative practice. As a result, much work has been done in this area also in the course of the last two decades. Whereas in the early 1960's it was almost impossible for a lay person to find a priest or rabbi who could or would instruct them in contemplative prayer, today this situation has dramatically changed. This meeting of East and West and the related developments mark a major moment in the history of American spiritual life.

As a result of these developments most religion departments offer at least a few courses which include some exploration of various aspects of the history of meditative and contemplative disciplines. The most concentrated study of meditation often goes on within the framework of the psychology of religion, which has been especially concerned with the study of religious experience and mysticism. In psychology departments, which are commonly dominated by faculty trained in physiological psychology as distinct from personality development, there is often little if any attention given to meditation. Psychology departments could do much more in this field, including a more serious study of transpersonal psychology and psychology of religion. In general the social sciences have done little research on meditation, and this needs to be encouraged.

The Practice of Meditation in Academic Courses

The discussion of academic coursework related to meditation raises an important question. Should a religion department instructor in an academic course be permitted or even encouraged to offer students opportunities to practice some form of meditation related to a tradition or traditions under study?

A number of professors are doing this today, some by taking a class to visit a Zen center or Christian monastery, for example. This is a delicate issue in a secular university or college for the fear is always there that a religion department professor may cross the line and get into religious indoctrination or begin to play the role of a guru with students. However, as long as that is not the case and as long as the person teaching a meditative practice has the training to do so, the exercises in meditation are introductory in nature, and substantial academic study forms the core of the course, such practical introductions to meditation will probably be accepted. They should be viewed as quite appropriate, for the simple reason that it is very difficult to understand and appreciate the nature of an activity which one has never directly experienced.

Should an instructor be permitted to offer a course, the chief objective of

which is to train students in the art and practice of some meditative discipline? Should students get academic credit for undergoing actual training in meditation at a meditation center outside the college? As a general rule, the answer to these two questions should be no, but some exceptions to this rule could be made. For example, it might be appropriate to give course credit for a period of training at a meditation center in the case of a college that has a one-month Winter Term (4-1-4 semester schedule) designed in part to permit off-campus learning in a variety of practical endeavors. If academic credit is to be awarded for a stay at a meditation center, some appropriate written critical reflection on the experience should be required. Along the same lines, a college might adopt a curriculum in which each student is permitted to take a few courses for credit toward the B.A. degree that are to be centered on practical learning with meditation practice as one of many options. A mechanism for evaluating the psychological fitness of students for such courses would, of course, have to be established.

Education in American colleges commonly suffers from a failure to connect information and experience, theory and practice, ideas and solutions to real problems. Much that goes on in the classroom is abstract and unrelated to the living experience of the students. Consequently much of it is not retained beyond the examination period. It is never digested and integrated into a student's real understanding so as to produce growth and wisdom. One remedy to this problem is to find new imaginative ways for students to learn by doing.

Since there are opportunities for abuse of authority and influence in the case of leading students in the practice of meditation, guidelines for this kind of situation should be developed, including identification of the kinds of meditation that are appropriate for use with undergraduates in an academic course. The existence of such guidelines would go far in avoiding problems and in diffusing apprehension and criticism. This could be the subject for a conference, or it could be made the focus of a session at the annual meeting of the American Academy of Religion.

The Role of Health Care Professionals, Psychological Counselors, and Chaplains

Students can also be introduced to meditation by health care and counseling professionals on campus and in and through a college program of extracurricular activities. As the medical and counseling professions integrate meditation into their understanding of preventive medicine and resources to deal with stress and anxiety, it will become natural for college health centers to provide information and even instruction in meditation. College chaplains are also in a position to offer and lead workshops on meditation, but few of them are trained in this field, which is of little interest to most theological seminaries.

Another approach involves an academic department or a chaplain's office establishing a program of visiting speakers and teachers in the field of meditation. Such programs require special funding, including travel expenses

and an honorarium for visitors. However, even with an annual budget of one or two thousand dollars, a meaningful program can be started. Strong on-campus leadership is essential, if the program is to be successful in involving students.

Organizing and Leading On-Campus Meditation Groups

My own experience in the late seventies and early eighties at Middlebury College taught me that if students, who have been introduced to meditation at a workshop, are to continue to practice, it requires the leadership of a committed faculty or staff member and an appropriate space. I occasionally offered workshops in basic Zen meditation at the College and would usually get 25 to 50 interested students to attend. Particularly for a beginner, it is very helpful to have a group to sit with. After each workshop, some would want to join such a group. Finding an appropriate space is difficult. Student activity space is always limited, and the competition for it is often intense. Setting up a large public room by moving aside furniture and bringing in cushions for each meditation session is not a very satisfactory arrangement. I finally secured a basement room in a dormitory for the exclusive use of the meditation group. It was set up with cushions and opened by Campus Security every morning at 6:30 a.m. and locked at 11 p.m. to discourage abuse of the space (which occurred on a few occasions).

As long as I sat on a regular schedule with the students, participation remained strong, and students would sit on their own from time to time. When my administrative duties at the College made it impossible for me to continue this involvement, the group gradually disbanded. The meditation room lasted at Middlebury for three years.

In summary, if students are to learn and practice meditation on campus beyond introductory workshops, the three essential are first, a faculty or staff person with appropriate training who will organize and lead a group; second, a space that is permanently committed to this purpose; and third, a regular schedule for group practice. It is not realistic to expect that a faculty or staff person will continue to lead a student meditation group on a purely voluntary basis indefinitely. It is a demanding responsibility and often requires the commitment of evening hours. Some compensation is necessary unless a staff person, such as a college chaplain or a student counselor, understands it to be part of his or her job description. Ideally, students would be offered a variety of appropriate introductory meditative disciplines to choose from, and a college meditation room would be designed so that it can be used by groups pursuing different traditions. Such a space should also be open for faculty and staff use.

With these needs in mind, I proposed to Middlebury College in 1982 creation of an interfaith center that would include a permanent meditation space as well as a director who would develop an appropriate program. The proposal is attached. The idea for this Interfaith Center was strongly influenced in certain

respects by Chapel House at Colgate University. The proposal was supported by about twenty faculty and staff, but it was never implemented. The College administration was not convinced that the facility would be well used by students, and meditation did not seem an important need to the administration, who had had no experience with it. There was also the problem of raising the money to build an interfaith center, maintain it, and staff it.

Chapel House is a non-denominational retreat center established to make available to lay people an opportunity for contemplative experience. It sits on the edge of the Colgate University campus and is open to students, faculty, and staff. However, Chapel House does not make a major effort to involve students. Its outreach is minimal. It distributes a mailing to entering students, but it does not have a regular program of workshops and lectures for students. The facility, which includes some overnight accommodations and an extensive library, is set up primarily for use by individuals who are expected to decide for themselves how they wish to use their time at the House. The Director estimates that about one-third of Colgate students visit Chapel House during their four years. The Director, who teaches Buddhist Studies, does bring his college students to the House to do Buddhist meditation as part of their coursework. Very few faculty and staff use the facility. Since group discussions and meetings are not encouraged, the College chaplains seldom use the House.

The majority of visitors to Chapel House are from off-campus and have no connection with the University. The House was founded through the generosity of the same donor who established the Center for the Study of World Religions at Harvard Divinity School. In contrast to Chapel House, the Interfaith Center proposed for Middlebury College would have as its central mission campus outreach and involvement of students, faculty, and staff.

Meditation Time and Space for Faculty and Staff

Another way that meditation can be introduced on the college campus is by faculty and staff practicing it with administration support. This support could involve a policy of allowing staff time for meditation during the work day and, again, creation of a space, or spaces, for it in buildings where people are working. A college administration would only do this if it were convinced that there is a real demand and that job performance and morale would be enhanced.

In conclusion, meditation can improve the quality of life of those who choose to practice it under the guidance of competent teachers. When pursued seriously as a discipline, it can add a unique depth to democratic and ecological living. It can help people become free and fully human. By itself meditation does not impel human beings to social action, and it needs to be counterbalanced by a concern with social reconstruction and personal relationship. However, in a democratic ecological society that affirms life in

the world and values social action and community, the practice of meditation can help to shape the direction of social action, contributing to an integration of the ethical and the political, the spiritual and the practical. The undergraduate college is one place where these issues should be thoughtfully explored.
